In order to complete his study of the motion of the planets, Newton had to combine his general Laws of Motion with a specific description of the force of gravity. Knowing the basic behavior of the planets from Kepler's Laws, Newton was able to determine an appropriate force law, the Universal Law of Gravitation:

Motion under gravity. ... Discussion. No! The force experienced also depends on the mass of the object. Figure 1 Gravitational force is proportional to mass. In fact, ... Thus the force of gravity you experience due to the Earth is proportional to your own mass. Someone with a mass of 50 kg experiences only half the gravitational force felt by ...

Forces and Motion Questions for Tests and Worksheets

A force is anything that can push or pull an object. Forces influence objects that are at rest or that are already in motion. Isaac Newton's three laws of motion describe how forces interact with objects to influence motion. These laws involve inertia, mass, velocity, and momentum. Key forces include gravity, friction, and magnetism.

Force is just a fancy word for pushing or pulling. If I push on something or pull on it, then I am applying a force to it. Force makes things move or, more accurately, makes things change their motion. Two natural forces that we have experienced are the force of gravity and magnetic forces magnetic forces.

Force and Motion: Facts (Science Trek: Idaho Public ...

The force of gravity is the weakest at the equator because of the centrifugal force caused by the Earth's rotation and because points on the equator are furthest from the center of the Earth. The force of gravity varies with latitude and increases from about 9.780 m/s^2 at the Equator to about 9.832 m/s^2 at the poles.

Gravity - Wikipedia

Gravity: Gravity, in mechanics, the universal force of attraction acting between all matter. It is by far the weakest force known in nature and thus plays no role in determining the internal properties of everyday matter. Yet, it also controls the trajectories of bodies in the universe and the structure of the whole cosmos.

Two experimental conditions were measured using 1) a simple pendulum and 2) a rotating table and the force of tension exhibited on a string was measured in both cases. In the case of a simple pendulum, the force of tension is equal to the force of gravity plus the force of centripetal motion.
